

STARLINK CREATES A GLOBAL INTERNET WEB

Dear friends of astrophysics,

I want to call to your awareness a largely undocumented process in the media that is taking place around our Earth, of which I was reminded again in an article in Earth Sky magazine today. This process is the steady permeation of the sphere around the Earth with small satellites which communicate with ground receivers to provide a global internet web network around our planet. The larger company creating this web of internet satellites is SpaceX, owned by Elon Musk. Starlink is the name of this particular component of the SpaceX corporation. Their goal is to create a network of up to 30,000 small satellites in low orbit around the Earth to form a complete internet web for global access on all parts of the Earth. As of July, 3,000 satellites have been put into orbit. Today is one of five launches in August of about 60 satellites per launch, adding another 300 satellites.

Astronomers are objecting to these satellites because they create light pollution in space obstructing astronomical viewing. Below is an image of how these orbits block telescopic viewing. The white lines are trails of light from 25 of 60 recently launched Starlink satellites. Starlink has promised to try and address this issue. But what is the real problem here?

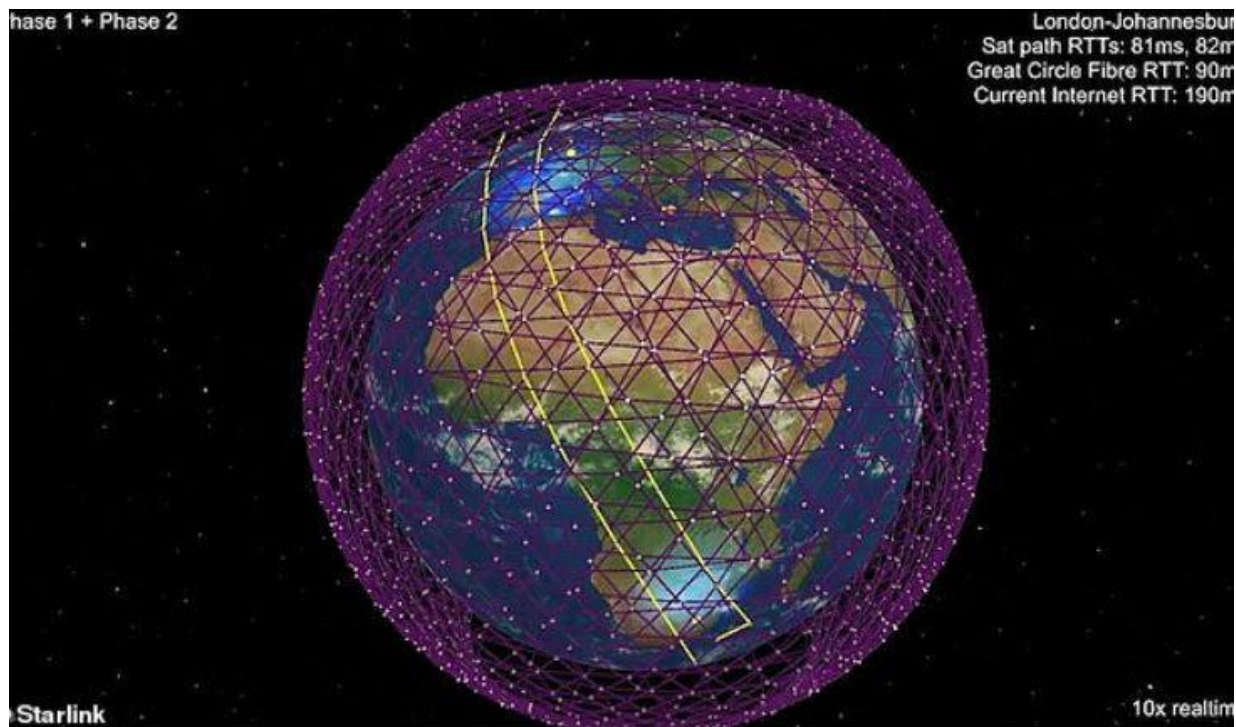

The deeper issue is of course the permeation of the sphere just around the Earth with 30,000 communication satellites forming this electronic web! Starlink satellites are in what is called "low orbit" which means they are as close to the Earth as possible without being in an atmospheric layer which will cause them to burn up like meteors do on entering a certain layer of our atmosphere. So they orbit at about 340 miles (550 km) altitude which is above the life ether sphere in what is called the thermosphere, which covers a long range of distance and can also be called the cosmic warmth ether layer. The lower levels of this layer are where we find the aurora events. The question then is in what ways this web of satellites and their accompanying electro/magnetic activity affects the spiritual layers of our Earth, even the capacities for spiritual thoughts to ascend and descend from the heavens. One must not see this strictly spatially but that the spatial is an image of a consciousness which seeks to consume, so to speak, or perhaps subsume, spiritual consciousness into its realm.

So how do we respond to a technological process enveloping our Earth in a web of internet? There is no stopping this as the world embraces it as true progress in enabling all regions, the most rural and underdeveloped, to have access to the internet. One can only meet it by first being full awake to what is happening and second by meeting this technological consciousness with spiritual consciousness. One way to do this through astrophysics is to realize that our picture of the cosmos as a spatial realm of matter is false. Rather is the cosmos a great realm of consciousness of beings of ascending ranks, who

wish to participate with humanity in its evolutionary process, as well as human beings ascending and descending from death and into birth, bringing the will of the divine into Earth existence and carrying the fruits of life into the cosmos. The higher beings do not interfere in our freedom but do await our conscious union with them as co-creators in building the new cosmos of spiritual substance born out of our transformative working in the Earth. When we work out of astrosophy to not picture the planets as material bodies, or "energies", but rather as spheres of higher consciousness which we can, through a path of cognition, hear and unite ourselves with, then we break through the web of electronic ahrimanic deception into the realm of true being.

To give an image of the Starlink future are two images from Starlink, the one at the start of the article and the other below.
